

# AdvisoryAI Hack-to-Hire: Challenge Briefs

## The Context: Life as a UK Financial Advisor

Before diving into the challenges, understand who you're building for.

A typical UK Independent Financial Advisor (IFA) manages 150-250 client relationships. They work within strict regulatory frameworks set by the Financial Conduct Authority (FCA), including Consumer Duty regulations introduced in 2023 that require demonstrating ongoing value to clients.

Their day is overwhelmingly reactive: responding to client emails, fielding calls, chasing paperwork, and drowning in administrative tasks. The irony? They became advisors to *advise* people—yet most spend 60-70% of their time on admin, not advice.

---

## A Note on Scope & Mock Data

This is a one-week hackathon. We're not expecting you to build integrations with CRM systems, portfolio platforms, or provider APIs—that's months of work.

Instead, work with mock data that represents realistic advisor scenarios. We'll evaluate your approach to the problem, your architecture, and your thinking—not whether you've connected to Intelliflo.

Create sample client profiles, example meeting notes, realistic document request scenarios. The mock data should feel authentic to the problems described below.

---

# Challenge 02: Proactive Chatbot ("Jarvis")

## The Problem Space

### The Reactive Trap

Financial advisors start each day with the best intentions to be proactive—reach out to clients, spot opportunities, add value. But then the emails land, the phone rings, a compliance deadline appears, and paperwork needs chasing.

By 5pm, they've been entirely reactive. The proactive work—the work that actually grows relationships and demonstrates value—never happens.

The advisor *knows* they should call Mrs. Patterson about her pension review. They just haven't had a moment all week. And next week won't be any different.

### The Memory Problem

With 200 clients, advisors cannot remember everything. Buried in CRM notes and meeting transcripts are details that could transform client relationships:

- Life events mentioned in passing (daughter's wedding, new grandchild, upcoming retirement party)
- Concerns expressed months ago that are still relevant (anxiety about market volatility, worry about inheritance tax)
- Opportunities that have time windows (approaching milestone birthdays, annual allowance deadlines, policy renewal dates)
- Follow-up commitments made but never calendared

These aren't just nice-to-haves. Under Consumer Duty, advisors must demonstrate they understand their clients and deliver personalised value. The information exists—it's just inaccessible when it matters.

### Information Overload, Insight Poverty

Advisors are surrounded by data but starved of insight. They might have access to:

- Meeting notes and transcripts from past conversations
- Client fact-finds and risk profiles
- Policy and product information
- Regulatory updates and compliance deadlines

None of this is synthesised. None of it surfaces at the right moment. The advisor has to *remember* to check, *remember* to act, *remember* to follow up. And with 200 clients, they simply can't.

## The Compliance Burden

The FCA's Consumer Duty requires advisors to demonstrate ongoing value. Annual reviews must happen and be documented. Advice suitability must be regularly validated. Client outcomes must be monitored.

Advisors aren't opposed to this—they want to do right by clients. But tracking who's due for review, who hasn't been contacted in 12 months, whose circumstances might have changed... it's a manual, error-prone process that creates constant low-grade anxiety.

---

## Context for Your Build

Think about the advisor's daily experience. They sit down at their desk with coffee, open their laptop, and face the day. What would genuinely help them? What would they trust? What would they actually use?

Consider the data an advisor typically has access to: client records, notes from past meetings, basic demographic information, policy details, calendar entries, task lists. Your mock data should reflect this reality.

The best solutions won't try to do everything. They'll pick a specific problem within this space and solve it well.

*Good luck builders.*
